

## What can I expect?

This system has a potential of banking **100-800+ pips per trade** trading with **Daily Chart**.

## See It For Yourself:

Let's see if you can spot the **correlation between the indicator and the price action**.

I bet you were able to spot that short entry (**300+ pips**). Tell me that you noticed that every time **AC changes color and crosses the 0 line** it gives us an entry signal. Am I right or right??

Did you see another short trade towards the left side of the chart?? That trade was worth **835 pips in 5 days**.

## So What Is The System?

### Setup:

1. Open up a daily chart on EUR/JPY.
2. Apply Bill Willam's Accelerator Oscillator (AC).
3. Apply Stochastic with setting 5,3,3 on top of AC. Use the template if don't know how to.
4. Try and use demo **MT4 from ODL securities**. Every broker has different time when they start a new daily candle. ODL seems to have the time that works best. **I only use their demo account for charts and place my trades on totally different broker**. Feel free to test other brokers.

**Short Entry:** RED AC below 0 and Stot below 0

**Long Entry:** Green AC above 0 and Stot above 0

**Exit:** **Opposite** Buy/Sell signal or as per Money Management.

**Money Management:**

1. Trade with 5 Lots with Stop Loss 100 pips away
2. Take Profit on 1<sup>st</sup> Lot at 50 pips. Move Stop Loss to Break Even (BE).
3. Take Profit on 2<sup>nd</sup> Lot at 100 pips.
4. Take Profit on 3<sup>rd</sup> Lot at 150 pips.
5. Take Profit on 4<sup>th</sup> Lot at 200 pips.
6. Let the 5<sup>th</sup> Lot run until you see an opposite entry signal.

The Risk/Reward ratio turns out to be **1:1 or better** depending on your 5<sup>th</sup> Lot. Since we trade on daily and would only take **trades with high probability of success**, 1:1 would work just fine.

If you choose to do back-testing then try and **ignore signals from late November to end of Dec**. Low volume during this time of the year creates wild swings.

Regards
